MRI RIGHT SHOULDER

Protocol:

Coronal T1, proton density FAT SAT and T2 Wt IRFSE sequences

Axial and sagittal proton density FAT SAT sequences

Complimentary CT sections were also performed.

OBSERVATIONS:

Head and neck of humerus are normal.

No evidence of abnormal marrow changes.

Greater and lesser tuberosities are normal.

Coracoid process is normal.

Mild acromio-clavicular joint arthropathy is noted in the form of soft tissue thickening.

Type-II acromion with lateral downsloping is noted impinging on the supraspinatus tendon.

Supraspinatus tendon appears minimally hyperintense on T2 Wt IRFSE images suggestive of tendinosis. Rest of the rotator cuff is normal.

Intrasubstance degeneration is noted within labrum.

Spino-glenoid notch is normal.

Bicipital groove is normal.

Biceps tendon is normal. No evidence of abnormal signal changes.

Fluid is seen surrounding the biceps tendon.

Mild joint effusion is noted.

Fluid is seen in subacromial - subdeltoid bursa – bursitis.

Muscles surrounding the shoulder joint appear normal.
